

Software Connectors 2

Role and Challenge of Software Connectors

How do we enable components A and B to interact?

What is the right answer?

Change A's form to B's form
Maintain multiple versions of A
Publish abstraction
Provide B with Transform or interface converter of Negotiated form
Separate B or B "essence" from its packaging
Make B multilingual

How to Select Connectors

- Determine a system's interconnection and interaction needs
- Determine roles to be fulfilled by the system's connectors
 - Communication, coordination, conversion, facilitation
- For each connector
 - Determine its appropriate type(s)
 - Determine its dimensions of interest
 - Select appropriate values for each dimension
- For multi-type, i.e., composite connectors
 - Determine the atomic connector compatibilities

Example

- A system to integrate consumer generated wellness data from multiple sources:
 - Sources of consumer data – with different access protocols and data format
 - Need to integrate
 - Access should be secure

Example

- We need to convert the diverse data formats.
- We need to have a uniform access protocol.
- We need to communicate them to the integration component.
- We need to ensure privacy of the individual

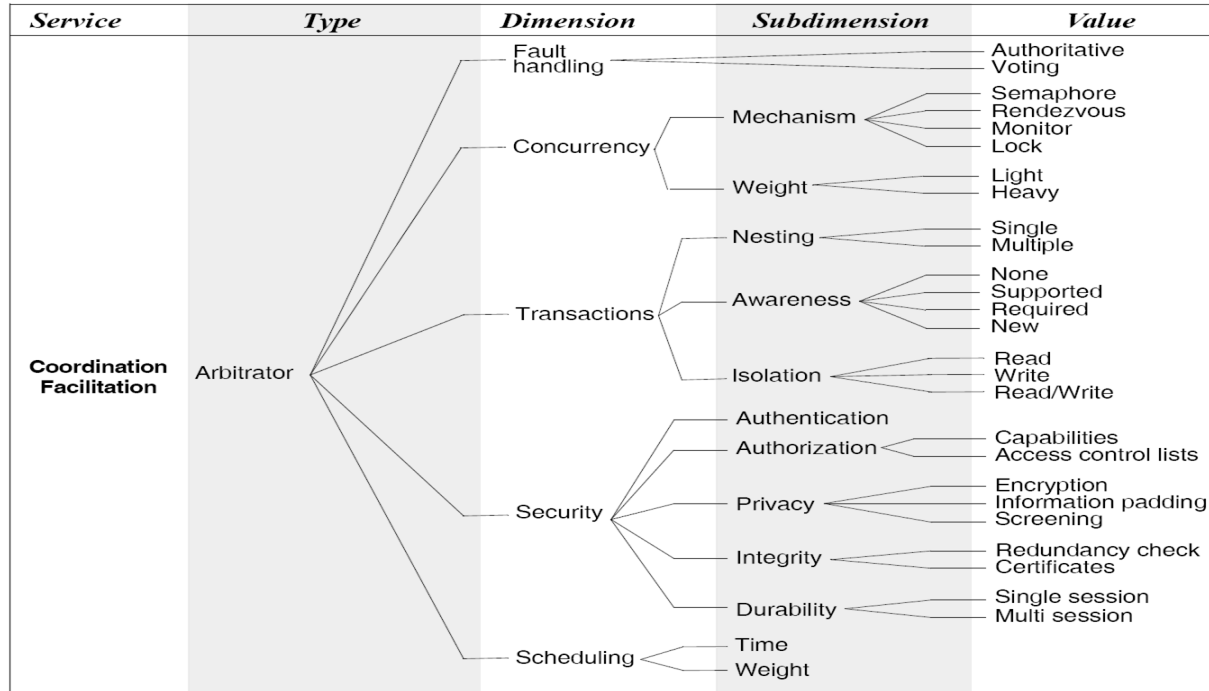

Example

- We need a different types of conversion adaptors
 - One to convert to uniform protocols
 - One to convert data formats
- We need communication connectors to connect the sources to an integrator component and to connect from the integrator to users.
- We need an arbitrator component to ensure users are authenticated and authorised.
- We need to think about what values to choose for our connectors
- We need to think about what constraints the environment might place on the choice of connectors.

Data Access Connectors

Arbitrator Connectors

Adaptor Connectors

| <i>Service</i> | <i>Type</i> | <i>Dimension</i> | <i>Subdimension</i> | <i>Value</i> |
|-------------------|-------------|---|---|-----------------------|
| Conversion | Adaptor | Invocation conversion Packaging conversion Protocol conversion Presentation conversion | Address mapping Marshalling Translation | Wrappers Packagers |

Summary

- Connectors are a key element in defining a software architecture.
- There is a wide variety of connectors and there is considerable diversity in their definition.
- Often connectors are combinations of various types.
- Analysing the requirements on an interconnection helps us to decide on the characteristics of a connector.
